"Complete genome sequence of an MI strain of Streptococcus pyogenes.";
Proc. Natl. Acad. Sci. U.S., 98:4658-4663[2001].

-I-FUNCTION: Through the carboxylation of phosphoenolpyruvate (PEP)
it forms oxaloacetate, a four-carbon dicarboxylic acid source for
the tricarboxylic acid cycle.
-I-CANALYTIC ACTIVITY: Phosphate + oxaloacetate = H(2)O +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         : | | : | | : | | : | | : | | : | | : | | ITDPNEIDSFRE-IMDSIVADSNIIY----RKL-VFDNPHFYDYFFEASPI---KEVSSL

RNA replication protein (147 kDa protein) (ORF 1) [Contains: RNA-discrete RNA polymerase (EC 2.7.7.48); Probable helicase].
Potato virus M (strain Russian) (VPM).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flexiviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        J. Gen. Virol. 72:9-14(1991).
-!- FUNCTION: RNA-replication. The central part of this protein
possibly functions as an ATP-binding helicase.
-!- ÇATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate

ALIGNMENTS

Glycosyl sulforransferase; GST-3; detection; diagnosis; leukocyte homing; selectin binding interaction; inflammation; lymphocyte homing; human; secondary lymph organ. This sequence is the human glycosyl sulfotransferase-3 (GST-3) of the invention. The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues. The sequences, antibodies and methods are useful in the diagnosts and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukcoytes to sites of inflammation and the normal homing of lymphocytes to secondary lymph organs Human and murine glycosyl sulfotransferase 3 and related polynucleotides Human glycosyl sulfotransferase-3 protein sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oliqo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide enroded by a full length human cDNA of the invention. Note: The sequence data for this parent dince from part of the printed specification, but was obtained in CD-ROM format directly from EPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              QPYYVMQVICQSQLEIYKTIQSLPKALQERYLLVRYEDLARAPVAQTSRMYEFVGLEFLP

Human transferase TRNSFS-11. 19-JUN-2000 (first entry)

```
The present invention provides a method of modifying an acceptor molecule by contacting the acceptor with an isolated betal, 3-N-
by contacting the acceptor with an isolated betal, 3-N-
cety/glucosaminyltransferase (betal, 3GnT) or an active fragment, where betal, 3GnT directs expression of a MECA-79 antigen. The invention also provides a method of treating or preventing an L-selectin-mediated condition by reducing the expression or activity of a betal, 3GnT that directs expression of a MECA-79 antigen. This can be done by administering to the subject an oligosaccharide L-selectin antagonist that inhibits binding of L-selectin to a MECA-79 antigen, for example by administering antibody material that specifically binds betal, 3GnT, and/or a betal, 3GnT antisense nucleic acid molecule. L-selectin antagonist conference and olicects MECA-79 antigen expression.

Alternatively, the expression or activity of LSST-2 or its active conference in combination with reducing the expression or activity of LSST-2 or its active activity of betal, 3GnT. The method is useful for treating L-selectin mediated conditions such as Crohn's disease and ulcerative colitis.

Inflammatory disorders of the skin such as allergic contact dermatitis, psoriasis and Lichen planus, lymphomas, circuic pneumonia, dalayed-type contact environment and apprend and hyperplastic thymus. This
                                                                                                                                                                                    New enzyme, useful for modifying acceptor molecule, comprises an isolated L-selectin sulfobransferase-2 that directs expression of L-selectin ligand antigen, MECA-79 in Chinese hamster ovary cells, or intestinal GloNAc 6-sulfobransferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence represents human LSST-2

23). The sequence was deduced from a cDNA clone (see AAZ94211) isolated from a gallbladder library. It shows homology to mouse Nacotylalucosamine 6-0-sulfotransferase. TRNSFS-11 is expressed in dermatologic and gastrointestinal tissues, especially those associated with inflammation and cell proliferation. The new human transferases and polymucleorides can be used in the diagnosis, prevention and treatment of cancer, developmental disorders, gastrointestinal disorders, genetic disorders, immunological disorders. neurological disorders, reproductive disorders, and semooth muscle disorders. The polypeptides can also be used to raise antibodies, and to screen for agonists and antagonists of
(see AAZ94211) isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transferase activity

                                                                                         Human and murine glycosyl sulfotransferase 3 and related polynucleotides.
                                                                                                                                               This sequence is the mouse glycosyl sulforransferase-3 (GST-3) of the invention. The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues. The sequences, antibodies and methods are useful in the diagnosis and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukocytes to sites of inflammation and the normal homing of lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                  28

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MLLPK--KMKLLLFLVSQMAILALFFHMYSHNISSLSMKAQPERMHVLVLSSWRSGSSFV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes human corneal N-acetylglucosamine-6-sulfatease(I), which is able to catalyse sulfation of keratan sulfate (KS). Also described is a method for monitoring the effect of treatments for macular corneal dystrophy (MCD), and detecting susceptibility to MCD. (I) is located to chromosome 16q22, and has ophthalmological activity. (I) can be used to treat or prevent macular corneal dystrophy types I or II. (I) makes possible treatment of MCD without requiring keratinoplasty or keratectomy. The present sequence represents mouse intestinal N-acetylglucosamine-6-sulfotransferase, which is given in comparison with (I) in the exemplification of the

cc beta). GST-4 gene is found on chromosome 16q23.1. GST is a type 2
membrane protein useful for inhibiting a binding event between a selectin
cand a selectin ligand, which comprises contacting the selectin with a non
cc sulphated selectin ligand, GST and a small molecular agent that inhibits
ct he sulphation activity of GST GST is also useful in inhibiting a
c he sulphation activity of GST GST is useful in gene therapy to treat
cc selectin mediated binding event. GST is useful in gene therapy to treat
cc disorders such as acute or chronic inflammation, systemic lugus
cerythematosus (SLB), rheumatoid arthritis, polyareritis nodosa,
cc polymyositis, dermatomyositis, systemic sclerosis, diabetes,
cc glomerulonephritis, mysathenia gravis, Sjogren's syndrome, Hashimoto's
cc glomerulonephritis, mysathenia gravis, Sjogren's syndrome, Hashimoto's
cc disease, darave's disease, adrenaltis, hypoparathyroidism, pernicious
canamis, demyelinating diseases, cirrhosis, ulcerative colitis,
cc dermatitis, myocarditis, regional enteritis, adult respiratory distress
cc syndrome, infantile eczema, psoriasis lichen planus, allergic rhintis,
cc bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection
during transplantation

                                                                                                                     New nucleic acid encoding corneal N-acetylglucosamine-6-sulfotransferase, useful for treatment, monitoring and diagnosis of macular corneal
                                                                                                                                                                                                                                                                                                                                                 59
                                                                                                                                                                          The present sequence represents human corneal N-acetylglucosamine-6-sulforransferase (I), which is able to catalyse sulfation of keratan sulfate (KS). Also described is a method for monitoring the effect of treatments for macular corneal dystrophy (WCD), and detecting susceptibility to MCD. (I) is located to chromosome 16q22, and has ophthalmological activity. (I) can be used to treat or prevent macular corneal dystrophy types I or II. (I) makes possible treatment of MCD without requiring keratinoplasty or keratectomy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LLPKKMKLLLFLVSQMAILALFFHMYSHNISSLSMKAQPERMHVLVLSSWRSGSSFVGQL

The invention relates to human drug metabolising enzymes referred as DWE and nucleic acid molecules encoding such enzymes. Polymucleotides of the invention are useful for assessing toxicity of test compounds and in gene therapy. Sequences of the invention are useful in the diagnosis.

Consention and treatment of autoimmune/inflammatory disorders such as acquired immune deficiency syndrome (AIDS), adult respiratory distress syndrome, allergies, anaemia, atheroscilerosis, asthma, autoimmune haemolytic anaemia, conteat dermatitis, Crohn's disease, syndrome, allergies, anaemia, atheroscilerosis, asthma, autoimmune correct dermatitis, Crohn's disease, alsomentifies, docdpasture's syndrome, gout, Grave's disease, disease, theumatorio appropriate irritable bowel syndrome, multiple sclerosis, conscenthritis, osteoporosis, psoriasis, systemic lupus erythematosus, contemnatoid arthritis, osteoporosis, psoriasis, systemic lupus erythematosis, bacterial, fungal parasitic, protozoal, helminthic infections, cell proliferative disorders such as actinic keratosis, arteriosclerosis, proliferative disorders such as actinic keratosis, arteriosclerosis, confidence, any primary brain tumours, addomena, infarction associated with pregnancy, aneuryems, vascular malformations; eve disorders such as primary brain tumours, addomena, infarctions enconunctivitis, iritis, retinitis, glaucoma, pigmentose disorders such as sociated diseases, hyperchylogemenia, ipid myopathies, Menkes syndrome, hypoglycaemia, lipid myopathies, Menkes syndrome, hypoglycaemia, lipid myopathies, mannosidosis, obesity; gastrointeglinal disorders such as dysphagia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated human drug metabolizing enzymes referred as DME 1-10, useful for diagnosing, treating, or preventing disorders associated with aberrant expression of DME such as allergy, anemia, asthma, infertility.
inflammatory disorder; acquired immune deficiency syndrome; infection; AIDS; adult respiratory distress syndrome; cell proliferative disorder; allergy; anaemia; conjunctivitis; actinic keracosis; arteriosclerosis; cancer; endocrine disorder; hypothalamus disorder; pituitary disorder; gastrointestinal disorder; metabolic disorder; developmental disorder; liver disorder; iritis; cystic fibrosis; Addison's disease; retinitis; goitre; diabetes; dysphagia; gastric carcinoma; anorexia; eye disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sl P, Tribouley CM;

The present sequence is mouse glycosyl sulfotransferase-4 (GST-4). GST-4 gene is found on chromosome BEI. GST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, comprises contacting the selectin hat inhibits the sulphation activity of GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SEE), rhemmatoid arthritis, polyarteritis nodosa, polymyositis, careful solerand solematomositis, systemic solerosis, diabetes, glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoro's disease, darenalitis, hypoparathyroidsm, periodicus anaemia, chempelinating diseases, cirrhosis, ulcerative colitis, dermatitis, myocarditis, regional enteritis, adult respiratory distress syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial cransplantation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            179 VRFFNLQSLYPLLKDPSLNLHIVHLVRDPRAVFRSRERTKGDLMIDSRIVMGQHEQKLKK 238

Yeh J, Hiraoka

The present invention provides a method of modifying an acceptor molecule by contacting the acceptor with an isolated betal, 3-Nacetylglucosaminyltransferase (betal, 3GTD) or an active fragment, where betal, 3GTD directs expression of a NECA-79 antigen. The invention also provides a method of treating or preventing an L-selectin-mediated condition by reducing the expression or activity of a betal, 3GTT that directs expression of a NECA-79 antigen. This can be done by administering to the subject an oligosaccharide L-selectin antagonist that inhibits binding of L-selectin to a MECA-79 antigen, for example by administering to the subject an oligosaccharide L-selectin antagonist and/or a betal, 3GTT antisense nucleic acid molecule L-selectin califoransferase-2 (LSST-2) also directs MECA-79 antigen expression.

Alternatively, the expression or activity of LSST-2 or its active conformed in combination with reducing the expression or activity of betal, 3GTT. The method is useful for treating L-selectin mediated conditions such as Crohn's disease and ulcerative colitis, psoriasis and Lichen planus, lymphomas, chronic pneumonia, delayed type hypersensitivity reactions, diabetes and hyperplastic thymus. This sequence represents mouse I-GlorAc6ST New enzyme, useful for modifying acceptor molecule, comprises an isolated L-selectin sulfctransferase-2 that directs expression of L-selectin ligand antigen, MECA-79 in Chinese hamster ovary cells, or intestinal GloNAC 6-sulfctransferase. 28 1 MLLPK--KMKLLLFLVSQMAILALFFHMYSHNISSLSMKAQPERMHVLVLSSWRSGSSFV 49.9%; Score 1017.5; DB 5; Length 395; 56.4%; Pred.                                                                                                                                                                                                                                                     The present invention describes human corneal N-acetylglucosamine-6-sulforransferase (I), which is able to catalyse sulfation of keratan sulfate (KS). Also described is a method for monitoring the effect of treatments for macular corneal dystrophy (MCD), and detecting susceptibility to MCD. (I) is located to chromosome log2, and has ophthalmological activity. (I) can be used to treat or prevent macular corneal dystrophy types I or II. (I) makes possible treatment of MCD without requiring keratinoplasty or keratectomy. The present sequence represents a consensus N-acetylglucosamine-6-sulfotransferase which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present sequence is human glycosyl sulfotransferase-4alpha (GST-4 alpha). GST-4 gene is found on chromosome 16q23.1. GST is a type 2 alpha). GST-4 gene is found on chromosome 16q23.1. GST is a type 2 and a selectin useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non sulphated selectin ligand, sor GST is also useful in inhibiting a selectin mediated binding event. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus contents such as acute or chronic inflammation, systemic lupus cypthomatics, dermatomyositis, polyarestifs nodosa, polymyositis, dermatomyositis, systemic selectis, diabetes, glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's disease, dermaltins, myocarditis, phypotacthyroidism, permicious anaemia, demyelinating diseases, cirrhosis, ulcerative collitis, commantitis, myocarditis, recema, psoriaeis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection curing transplantation. Note: The present sequence is also shown in correction (bring transplantation. Note: The present sequence is also shown in correction control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LEGOHPDVFYLMEPAWHVWNTFKQSTAWMLHMAVRDLIRAVFLCDMSVFDAYMEPGPRRQ 120

Also described is a method for monitoring the effect of treatments for macular corneal dystrophy (MCD), and detecting susceptibility to MCD. (I) is located to chromosome 16422, and has ophthalmological activity. (I) can be used to treat or prevent macular corneal dystrophy types I or II. (I) makes possible treatment of MCD without requiring keratinoplasty or keratectomy. The present sequence represents human intestinal N-acetylglucosamine-6-sulfotransferase, which is given in comparison with (I) in the exemplification of the

Patent No. 6551809
GENERAL INFORMATION:
APPLICANT: YAN, Chumhua et al.
TITLE OF INVENTION: ISOLATED HUMAN PHOSPHATASE PROTEINS,
TITLE OF INVENTION: WUCLBIC ACID MOLECULES ENCODING HUMAN PHOSPHATASE PROTEINS,
TITLE OF INVENTION: AND USES THEREOF
FILE REFERENCE: CL001171

Sequence II. Application US/09150141B

Sequence III. Application US/09150141B

Patent No. 6071732

GENERAL INFORMATION:

TITLE OF INVENTION: TYROSYLPROTEIN SULFOTRANSFERASES, NUCLEIC ACIDS ENCODING

TITLE OF INVENTION: TYROSYLPROTEIN SULFOTRANSFERASES, AND METHODS OF USE THEREOF

TITLE OF INVENTION UNMER: US/09/150,141B

CURRENT APPLICATION NUMBER: US/09/150,141B

CURRENT PAPLICATION NUMBER: US/09/150,141B

CURRENT PALING DATE: 1998-09-09

NUMBER OF SEQ ID NOS: 45

SEQ ID NOS: 45

SEG ID NO: 11

LENGTH: 359
                                                                                                                                                                                                                                              Sequence 11, Application US/09150133B
Sequence 11, Application US/09150133B
Sequence 11, Application US/09150133B
Setent No. 6060295
GENERAL INFORMATION:
APPLICANT: The Board of Regents of the University of Oklahoma
TITLE OF INVENTION: TYROSYLPROTEIN SULFOTRANSFERASES, NUCLEIC ACIDS ENCODING
TITLE OF INVENTION: TYROSYLPROTEIN SULFOTRANSFERAES, AND METHODS OF USE THEREOF
FILE REFERENCE: 5820.504
